How is the error computed:

Normawise relative backward error (NBRE v1); called *backward error* in the documentation:

$$\text{NBRE} = \max_{i \in \{1 \ldots n\}} \frac{|b - Ax|_i}{(|A||x| + |b|)_i}$$

Scaled residuals (SR):

$$\text{SR} = \frac{\max_{i \in \{1,\ldots,n\}} |\sum_{j=1}^{n} a_{ij} x_j - b_i|}{\|A\|_\infty \|x\|_\infty}$$

Table 1: The error levels achieved in SSIDS. Failure rate is 0% for all the test cases.

All results presented in this document have been computed on one node of Oak Ridge OLCF summit supercomputer.
Note: ma57 is a non-threaded, non GPU accelerated code. This set of results has been included for completion.

SSIDs computations can be split into three basic phases:

1. Analysis,
2. Factorization,
3. Solve.

All times are given in seconds.

Ipopt – one time period				
Method	Analyse	Factor	Solve	TOTAL
CPU	0.0009	0.0036	0.0008	0.0053

Ipopt – two time period				
Method	Analyse	Factor	Solve	TOTAL
CPU	0.0016	0.0071	0.0015	0.0102

TAMU 500				
Method	Analyse	Factor	Solve	TOTAL
CPU	0.0210	0.1361	0.0185	0.1756

For the Case118 matrices, MA57 fails with *incorrect objective type* error.
